Week 1_Asset_Inventory

Why: You can't protect what you don't know. The inventory lists what the organization must protect and rates how critical each item is, so the gaps found in week 2 can be prioritized.

1-Rating method

- **C-Confidentiality**: harm if the asset or its data is seen by the wrong person.
- **I-Integrity**: harm if the data is changed or corrupted.
- **A-Availability**: harm if the asset is unavailable when staff need it.
- **Scale:** High / Medium / Low for each of C, I and A.
- **Criticality**: the highest of the 3 ratings. One high is enough to make an asset High.

IDs: the letter shows the type of item and the number is its order. M= Machine, D= Data, S= Service or item outside the audit scope.

2-Machines

Facts collected directly from each virtual machine on 30 Octobre, 2026, with read-only commands. Screenshots are in "Week 1-Screenshots".

ID	Machine	Facts collected	Owner	Managed by	Data held	C	I	A	Criticality
M01	Employee laptops (*10), sample: DESKTOP TVVAHP9	Windows 11 Enterprise Evaluation, build 26300	Owner / Director	Office administrator	The working copies of client records; payroll files on the payroll officer's laptop	High	High	Medium	High
M02	File server: fileserver01	Ubuntu 24.04.5 LTS, kernel 6.8.0-147-generic, x86-64	Owner / Director	Office administrator	Client records, payroll files, internal docs, website content & brochures.	High	High	High	High
M03	Audit workstation: kali	Kali GNU/ Linux Rolling, kernel 6.19.14+kali-amd64, x86-64	Me (auditor)	Me (auditor)	Audit tools and results	-	-	-	Not rated

How the facts were collected

• **M01(Windows):** Get-CimInstance Win32_OperatingSystem | Select-Object CSName, Caption, Version → computer name, Windows edition, build number.

• **M02 (Ubuntu):** hostnamectl→server name, Ubuntu version, kernel, architecture.

• **M03 (Kali):** hostnamectl→machine name, Kali version, kernel, architecture.

The lab uses Windows 11 Enterprise Evaluation, which Microsoft provides as full-featured software for 90 days. It includes the same features as the licensed Enterprise edition, so the audit results apply.

Why these ratings

• **M01- Laptops**: C and I are High because employees open client files on them: if someone sees the files or the figures are changed, clients are harmed. A is Medium because if one laptop breaks, the employee can borrow another for a day and the firm keeps working.

• **M02- File server**: C and I are High because it holds client files and payroll, the most sensitive data, in one place. A is High because if it stops, nobody in the firm can open the shared files and all work stops.

• **In short**: one laptop down affects one person; the server down affects everyone.

• **M03- kali**: audited with Lynis 3.1.6, as agreed. It's my audit workstation, not an asset of the organization, so it is not given a CIA rating.

3-Data

ID	Data	Level	Owner	Used by	Stored on	C	I	A	Criticality
D01	Payroll data & staff personal details	Restricted	Owner / Director	Payroll officer, Owner / Director	M02, payroll officer's laptop (M01)	High	High	Medium	High
D02	Client tax & financial records	Confidential	Owner / Director	7 accountants	M01, M02	High	High	High	High
D03	Internal procedures & template	Internal	Owner / Director	All staff	M02	Low	Medium	Low	Medium
D04	Website content & brochures	Public	Owner / Director	Office administrator	M02	Low	Medium	Low	Medium

How data links to the audit

The audit tools check the machines, not the data itself. The data ratings show which machine findings matter most: M02 holds the payroll and client records, so its gaps come first.

Why these ratings

• **D01-Payroll data: C** High: a leak would expose staff salaries and personal details. Under GDPR, a breach of personal data must generally be reported to the data protection authority within 72 hours. **I** High: an altered figure means wrong salaries or wrong social contributions. **A** Medium: the data is mainly needed during the monthly payroll run; a one-day outage outside that period has little effect.

• **D02-Client records: C** High: clients trust the firm with their financial details; a leak would break that trust and could cost clients. The records may also include personal data of business owners. **I** High: a wrong figure produces a wrong tax return, and the client may face penalties. **A** High: accountants use the records every day; missing a tax deadline means penalties for the client.

• **D03-Internal procedures and templates: C** Low: no client or personal data. **I** Medium: a changed template or procedure would spread errors into client work. **A** Low: staff can work from older copies for a few days.

• **D04-Website and brochures: C** Low: written to be public. **I** Medium: altered text could give clients false info or damage the firm's image. **A** Low: if these files are unavailable for a while, client work continues.

4-Outside the audit scope (listed for completeness)

ID	Item	Reason not audited	Criticality
S01	Email service	Run by an external provider on its own computers.	High
S02	Accounting software	Run by an external provider on its own computers.	High
S03	Office network: router, Wi-Fi, printer	Not part of the agreed scope of 3 machines	Medium

The firm depends on these services every day: if email or the accounting software stops, client work stops too. The firm remains responsible for the data they hold, even though the providers run the systems. Checking the providers' own system is outside this project, but the firm's dependence on them is recorded as a risk in the risk register (Week 3).
